**What do I want to learn or understand better?**

I want to be better at the documentation part, sometimes its hard for me to explain an idea running in my head. Write better user stories and making them independents is a thing a need to be better at. Making a responsive website is also very important and hard to do with lacking CSS knowledge so my plan is to be better at them for the next projects.

**How can I help someone else or the entire team to learn something new?**

In this project I learned that some members can be afraid to ask questions so showing them that they are welcome to ask questions is good. Both for the project and for develop relationships between the members which lead to that the work of the team becoming more efficient and more fun.
in my next projects I will focus on pair programming since it's a good opportunity to help other members and learn from them.

**What is my contribution towards the team's use of scrum?**

I attended the meetings and followed Trello to follow the progress of the project and make plan to reach our goal before the deadline. I had a good communication with my team when it comes to the project, and I followed the plans of the sprints.

Learning how to write good user stories is not just good for the technical aspect but for scrum as well. Since it makes the planning of the sprints easier and sharing the work between the members is fairer so it's something I must learn for the next projects.
To reach my goal I will try to read a scrum book called "Scrum: the art of doing twice the work in the half the time" written by scrum co-creator Jeff Sutherland.

**What is my contribution to towards the teams' deliveries?**

I completed my tasks every sprint such as the application header, recipe page and part of calculator page. I did the first mockup of the application design and tried to help other members with their task when they needed help.

I don't think we solved all our bugs/problems in a best practice way. Responsiveness could be better and more adjusted to smart phones so it's a think to make better in the coming projects and to reach that I need to do more coding and watch tutorial to learn algorithms and ways to solve software problems in an efficient way.
